Linhai 300 rok 2006 Po naštartovaní a pridaní plynu okamžite zdochne. Ak ju nechám aj naštartovanú desať minút aby sa zohriala aj tak po pridaní plynu zdochne. Ak ju nechám stále bežať na voľnobeh tak po cca 15minútach začne akoby vynechávať a zdochne aj sama. Potom už nenaštarujem a sviečka ostane ľahko čierna a je ko. Kartáč nepomôže jedine nová sviečka. A zase sa to opakuje. - Karburátor vyčistený. Nepomohlo - tak nový. Výsledok to isté. - Nová indukčka, nové CDI, cievky statora (napätie po naštartovaní cca 14,3V) - Nový piest, piestne krúžky. - vyčistenie hlavy, výmena ventilov a nastavenie - rozvod nastavený OK Má niekto nejaký nápad prosím?

It sounds like you've gone through quite a bit of troubleshooting with your Linhai ATV 300. Have you considered checking the fuel quality or the fuel system? Sometimes, issues can arise from something as simple as a clogged fuel line. I had a similar experience once, and while I was resolving it, I found some distraction in games like [block breaker](#), which helped me take my mind off the frustration. Hopefully, you can find a solution soon!

Kyr5D 03.07.2025 10:40:56

Wow, that sounds incredibly frustrating! I had a similar issue with an old scooter once, and it turned out to be a fuel delivery problem even after cleaning the carb. Have you checked the fuel lines for any kinks or blockages? It could also be a vacuum leak somewhere. Maybe try running it with the fuel cap slightly loose, just in case there's a venting issue. For a bit of fun and inspiration, search online for videos of how people fix their cars. There's even one game called [Eggy Car](#) that gets you thinking about moving around obstacles in odd ways, maybe it'll spark an idea! Good luck!

JamesWeinbe 12.01.2026 09:16:43

Well, that's a head-scratcher, isn't it? Seems like you've thrown everything but the kitchen sink at this engine! Sounds vaguely familiar, like a persistent gremlin. Maybe it's an alien artifact messing with the fuel mixture. Speaking of fuel, is the fuel line clear? I remember back when I had my old scooter, I had a similar issue. I had the [drift hunters](#) crew look at it, turned out to be a tiny air leak in the intake manifold, causing the whole system to go haywire.
